In Euclidean geometry, a regular polygon is a polygon that is equiangular (all angles are equal in measure) and equilateral (all sides have the same length). Regular polygons may be either convex or star. In the limit, a sequence of regular polygons with an increasing number of sides approximates a circle, if the perimeter is fixed, or a regular apeirogon, if the edge length is fixed.

In elementary geometry, a polygon (/ ˈɒlɪɡɒn /) is a plane figure that is bounded by a finite chain of straight line segments closing in a loop to form a closed polygonal chain or circuit. These segments are called its edges or sides, and the points where two edges meet are the polygon's vertices (singular: vertex) or corners. The interior of the polygon is sometimes called its body.

Section 11.1 Composite Figures Area of a Regular Polygon The area of a regular polygon can be found using the perimeter (P) and the distance from the center to the midpoint of a side (r).  $A = \frac{1}{2}rP$  For example, the area of a regular hexagon with

It is a trivial task to calculate the areas of both rectangles, then add them together. The resulting value would be a rough approximation of the area of the curve we are studying.

Below is a list of OGC Implementation Standards. Implementation Standards are different from the Abstract Specification. They are written for a more technical audience and detail the interface structure between software components.
