The cytidyl transferase IspD is a key enzyme in the methylerythritol phosphate (MEP) pathway for early isoprenoid biosynthesis. As an essential enzyme present in many human pathogens, it is a promising target for the development of new antimicrobial agents.

Organic reactions are chemical reactions involving organic compounds. The basic organic chemistry reaction types are addition reactions, elimination reactions, substitution reactions, pericyclic reactions, rearrangement reactions, photochemical reactions and redox reactions. In organic synthesis, organic reactions are used in the construction of new organic molecules.

Organic reaction - Wikipedia

In chemistry, an organic compound is generally any chemical compound that contains carbon. Due to carbon's ability to catenate (form chains with other carbon atoms), millions of organic compounds are known. Study of the properties and synthesis of organic compounds is the discipline known as organic chemistry. For historical reasons, a few classes of carbon-containing compounds (e.g., carbonates ...

<< Dienes | Aromatics | Aromatic reactions >>. After understanding the usefulness of unsaturated compound, or conjugated system, we hope to explore the unique structure of aromatic compounds, including why benzene should not be called 1,3,5-cyclohexatriene because it is more stable than a typical triene, and seemingly unreactive. Called "aromatic" initially because of its fragrance, aromaticity ...

Background. Metal-organic frameworks (MOFs) are made by linking inorganic and organic units by strong bonds (reticular synthesis). The flexibility with which the constituents’ geometry, size, and functionality can be varied has led to more than 20,000 different MOFs being reported and studied within the past decade.

The Chemistry and Applications of Metal-Organic Frameworks

Built to perform: A facile, one-step hydrothermal method is used to synthesize a 3D, symmetric, flowerlike Sb₂S₃ nanostructure (see figure) for application as a photoelectric material. The structure is composed of numerous nanoneedles, which provided a large void fraction and specific surface area, and has better electrocatalytic activity and charge-transfer ability than that of platinum.
